

Technical Field of the Invention

5 The present invention relates to SHIP 1, a negative regulator of cell proliferation and survival and immune cell activation.

Background of the Invention

SHIP 1, selectively hydrolyzes the 5-phosphate from inositol 1,3,4,5-tetraphosphate (IP4) and phosphatidylinositol 3,4,5-triphosphate (PIP3). United States Patent No. 6,238,903 discloses that SHIP 1 is an enzyme regulator of signaling pathways that control gene expression, cell proliferation, differentiation, activation, and metabolism, particularly of the Ras and phospholipid signaling pathways. SHIP 1 plays an important role in cytokine and immune receptor signal transduction. SHIP 1 disrupted (SHIP 1 ^{-/-}) mice exhibit a myeloproliferative phenotype characterized by overproduction of granulocytes and macrophages¹. SHIP 1^{-/-} mast cells are more prone to IgE and Steel factor induced degranulation, while SHIP 1^{-/-} B cells are resistant to negative regulation by Fc RIIB. SHIP 1 is also involved in the pathogenesis of chronic myelogenous leukemia².

Compounds that specifically modulate the activity of SHIP 1 would be useful in the treatment of cell proliferation, hematopoietic and immune disorders, as well as for manipulating SHIP 1 mediated pathways during investigatory and drug discovery testing. To date, no structure of a small molecule SHIP 1 specific modulator has been disclosed.

A sesquiterpene compound termed pelorol may be obtained from various marine sponge species, including *Petrosaspongia metachromia* and *Dactylospongia elegans*. Kwak et al. and Goclik et al. each disclosed the structure of pelorol and its extraction from different marine sponges.^{4,5} Pelorol was reported as having weak antitrypanosomal and antiplasmodial effects⁵. The precise structure of pelorol is as follows, with Me representing a methyl group and relative configuration of chiral atoms (C-5, 8, 9 and 10) shown.

Pelorol

Some reduced and substituted chrysene derivatives similar to pelorol and having the characteristic *gem* substituted non-aromatic ring of pelorol are known as intermediates or derivatives in the preparation of various polycyclic polyprenols found in shale⁶⁻¹², in the preparation of taxodione¹³, and in the compound 1,2,3,4,4a,4b,5,6,10b,11,12,12a-dodecahydro-1,1-dimethyl-chrysene¹⁴. None of these chrysene derivatives are known to have biological activity.

Summary of the Invention

This invention is based on the discovery that pelorol and related compounds are capable of modulation of SHIP 1 activity.

Some embodiments of this invention provide novel compounds of Formula I and salts thereof. Compounds of Formula I have the structure:

I

wherein;

R_1 and R_2 are independently selected from the group consisting of: $-CH_3$, $-CH_2CH_3$, $-CH_2OH$, $-CH_2OR'$, $-CHO$, $-CO_2H$, and $-CO_2R'$;

R_3 and R_4 are independently selected from the group consisting of: H , $-CH_3$, $-CH_2CH_3$, $-CH_2OH$, $-CH_2OR'$, $-CHO$, $-CO_2H$, and $-CO_2R'$;

Q is selected from the group consisting of: $-CH_2-$, $-CY_1Y_2-$, $-CH_2CH_2-$, $-CH=CH-$, $-CY_1Y_2CY_3Y_4-$, $-CH_2CH_2CH_2-$, $-CH=CHCH_2-$, $-CH=CHCY_1Y_2-$, and $-CY_1Y_2CY_3Y_4CY_5Y_6-$; where Y_1 , Y_2 , Y_3 , Y_4 , Y_5 , and Y_6 are independently selected from the group consisting of: H , F , Br , Cl , I , OH , OR' , and SH ; or any one group of Y_1/Y_2 , Y_3/Y_4 , and Y_5/Y_6 may be $=O$; or Y_1/Y_3 may form an epoxide; and, at least one of Y_1 , Y_2 , Y_3 , Y_4 , Y_5 and Y_6 when present, is not H ;

X_1 , X_2 , X_3 , and X_4 are independently selected from the group consisting of: H , R , OH , $-OR$, $-CO_2H$, $-CO_2R'$, F , Br , Cl , I , $-CN$, $-SO_3H$, $-OSO_3H$, NO_2 , NH_2 , $-NHR$, and $-NR_2$; where R is a linear, branched, or cyclic, saturated or unsaturated one to ten carbon alkyl group that is unsubstituted or is substituted with one or more of: OH , $=O$, SH , F , Br , Cl , I , NH_2 , $-NHR'$, $-NR'_2$, NO_2 , $-CO_2H$, $-CO_2R'$, and epoxide;

and R' is a linear, branched, or cyclic, saturated or unsaturated one to ten carbon alkyl group that is unsubstituted or substituted with one or more of: OH , $=O$, SH , F , Br , Cl , I , NH_2 , $-NHR''$, $-NR''_2$, NO_2 and $-CO_2H$ where R'' is a linear, branched, or cyclic, saturated or unsaturated one to ten carbon alkyl group.

Novel compounds of Formula I of this invention do not include the precise structures of previously described *gem* substituted chrysene derivatives. These previously described compounds include pelorol and compounds having the following structures in which Me is methyl:

and

Alternately defined, this invention excludes such previously known specific compounds of Formula I in which each of $R_1 - R_4$ are methyl; Q is $-\text{CH}_2\text{CH}_2-$; and, $X_1 - X_4$ is according to any one of the following definitions:

- (a) X_1 and $X_2 = \text{OH}$, $X_3 = \text{H}$, and $X_4 = -\text{COOCH}_3$;
- (b) X_1, X_2, X_3 and $X_4 = \text{H}$;
- (c) X_1, X_2 , and $X_4 = \text{H}$, and $X_3 = \text{CH}_3$;
- (d) X_1, X_3 , and $X_4 = \text{H}$, and $X_2 = \text{CH}_3$;
- (e) X_2, X_3 , and $X_4 = \text{H}$, and $X_1 = \text{CH}_3$; and
- (f) X_1 and $X_4 = \text{H}$, X_2 and $X_3 = \text{OCH}_3$.

Also excluded is a compound of Formula I in which R_1 and $R_2 = \text{CH}_3$; R_3 and $R_4 = \text{H}$; Q $= -\text{CH}_2\text{CH}_2-$; and each of $X_1 - X_4$ is H.

Some embodiments of this invention provide a pharmaceutical composition comprising one or more compounds of Formula I or pharmaceutically acceptable salts thereof, and a pharmaceutically acceptable carrier. Such compositions may comprise previously known compounds of Formula I which have not been known as biologically active compounds suitable for pharmaceutical use.

Some embodiments of this invention provide a method of treatment or prevention of an immune, inflammatory, or neoplastic disorder or condition, comprising

administering to a patient in need of such treatment or prevention, an effective amount of a compound of Formula I or pharmaceutically acceptable salt thereof, or a pharmaceutical composition of this invention.

Some embodiments of this invention provide the use of a compound of Formula I or pharmaceutically acceptable salt thereof for modulation of SHIP 1 activity and for preparation of agents for the modulation of SHIP 1 activity. Such modulation may be *in vitro* or *in vivo*. Agents for *in vivo* use include a pharmaceutical composition of this invention as well as agents adapted for *in vitro* use. The modulation may be for a treatment or prevention of an immune, inflammatory, or neoplastic condition or disorders as described above.

Some compounds of Formula I may be prepared in whole or in part by fractionating biological extracts or by derivatizing available compounds. Alternately, compounds of Formula I may be prepared by total synthesis.

Some embodiments of this invention provide a method of making a compound of Formula IA

in which R₁ – R₄, X₁, X₃, and X₄ are as defined for Formula I, L' is a C₁ – C₄ saturated or unsaturated alkyl linking group; and A is an activating group; comprising reacting a compound of Formula IIA or IIB:

5

II A

II B

- 10 in which L is absent or is a C₁ – C₃ saturated or unsaturated alkyl linking group and E and E' are electrophilic reactive groups; with a compound of Formula III

15

III

- 20 in which Nu is a group that renders the compound of Formula III nucleophilic at Nu, followed by optional reduction and by hydrolysis, to produce a compound of Formula IV

25

IV

30

and condensing the compound of Formula IV to produce a compound of Formula IA.

L' in compounds of Formula IA may optionally be changed or derivatized to form a desired component Q of Formula I. For example, component L' in compounds of Formula IA produced by the preceding method may have different degrees of saturation or different substituents as compared to Q in a compound of Formula I. In order to reduce the number of atoms in the ring, a compound having an unsaturated L' group could be subjected to oxidizing and reduction steps to reduce the size of the ring in Formula I comprising Q. In addition, functionalities such as ketone, hydroxyl, or other groups may be added to L' to form a desired Q component.

Preferred electrophilic reactive groups for E are lactone, ester, and thioester. A preferred group for E' is carboxyl. More preferably, compounds of Formulas IIA and IIB are as follows.

Even more preferably, compounds of Formulas IIA and IIB are as follows:

A preferred Nu in compounds of Formula III is lithium which may be substituted onto the ring for a halogen such as bromine. Preferably, A in the compound of Formula III is an activating group such as -OMe or NHAc (Me = methyl and Ac = acetyl) which group may be subsequently converted to a desired substituent for X₂ in compounds of Formula I. Substitutents may also be protected, where appropriate with a protecting group such as TBS.

Brief Description of the Drawings

Figure 1 is a graph depicting the effect of sponge extracts on SHIP 1 enzyme activity *in vitro*.

Figure 2 is a graph depicting the effect of pelorol on macrophage nitric oxide (NO) production.

Figure 3 is a graph depicting the effect of pelorol on IgE mediated mast cell activation.

Detailed Description of the Invention

In this specification, the following abbreviations will appear: THF (tetrahydrofuran); n-buLi (n-butyly lithium); t-buLi (tert-butyly lithium); Ph₃PMe (methyl triphenyl posphonium bromide); PCC (pyridinium chlorochromate); Ac (acetyl); Me (methyl); Et (ethyl); prop. (propyl); but. (butyl); RT or, r.t. (room temperature); hr. (hour(s)); DMSO (dimethylsulfoxide); DNFB (2,4-dinitrofluorobenzene); LPS (lipopolysaccarhide); TNF- α (Tumor Necrosis Factor Alpha); TBS (tert-butyly dimethylsilyl); and EA (ethyl acetate).

SHIP 1 Modulating Compounds

Compounds of Formula I have chiral centres at C-5, C-8, C-9 and C-10 and may be chiral at C-4 depending upon whether R₁ and R₂ are different. Compounds of this invention include all stereoisomers and enantiomers of compounds of Formula I. Some embodiments have the same relative configuration of chiral centres as does pelorol or are enantiomers thereof, namely: S, R, R, S; or R, S, S, R (at C-5, 8, 9 and 10 respectively). Some embodiments have the same absolute configuration as pelorol at chiral centres. Some embodiments have the same relative configuration as pelorol at C-5 and C-10 with

independently variable configurations at C-8 and C-9. Some embodiments have the same relative configuration as pelorol at C-5, C-8, and C-10 with variable configuration at C-9. In all cases, the configuration at C-4 (if chiral) may be variable or may be the same relative configuration to the remaining chiral centres as is shown in examples of structures of compounds of Formula I illustrated herein.

In various embodiments of this invention, the compounds may have the limitations in Formula I described above or may have more specific limitations with respect to substituents Q, $R_1 - R_4$, and $X_1 - X_4$. Any combination of the following limitations is encompassed by this invention.

- 10 (a) Q may be as defined for Formula I except that Y_{1-6} is limited to H or halogen;
- (b) Q may be limited to $-CH_2-$, $-CH_2CH_2-$, $-CH=CH-$, $-CH_2-CH_2CH_2-$ and $-CH=CHCH_2-$;
- (c) Q may be limited to H or saturated moieties in the limitation of Formula I,
- 15 or according to the limitations of paragraph (a) or (b) above;
- (d) Q may be limited to a one or two carbon skeleton within the limitations of Formula I, or according to the limitations of any of paragraphs (a) - (c) above;
- (e) one or both of R_1 and R_2 may be limited to methyl, ethyl, $-CH_2OH$ or $-CH_2OR'$;
- 20 (f) R' in one or both of R_1 and R_2 according to Formula I, or the limitation of paragraph (e) above, may be limited to methyl, ethyl, propyl or butyl;
- (g) one or both of R_1 and R_2 may be limited to methyl or ethyl;
- (h) one or both of R_1 and R_2 may be limited to methyl;
- (i) R and R' in any one or more of $X_1 - X_4$ may be limited to unsubstituted
- 25 methyl, ethyl, propyl or butyl;
- (j) one or more of $X_1 - X_3$ may be limited to H, R, OH, OR, halogen, $-CONH_2$, $-CONHR'$, $-COR'_2$, NHR or NR_2 where R and R' are limited as in Formula I, or R and R' may be according to paragraph (i) above;
- (k) one or more of $X_1 - X_3$ is limited to H, OH, OR, $-CONH_2$, $-CONHR'$, and
- 30 $-COR'_2$, where R and R' are as in Formula I, or R and R' may be limited according to paragraph (i) above;
- (l) one or more of $X_1 - X_3$ may be limited to H, OH, and OCH_3 ;

(m) X_4 may be limited to H, R, OH, OR, CO_2H or $-\text{CO}_2\text{R}'$, with R and R' as in Formula I, or R and R' may be limited according to paragraph (i) above;

(n) X_4 may be limited to H, R, OH, OCH_3 , $-\text{CO}_2\text{H}$ and $-\text{CO}_2\text{R}'$ with R and R' limited according to paragraph (i) above; and,

5 (o) X_4 may be limited to H, R, OH, OCH_3 , $-\text{CO}_2\text{H}$ or $-\text{CO}_2\text{CH}_3$.

The following specific structures are embodiments of this invention. In some cases, variability at X_1 , X_2 , and X_4 is shown with reference to substituents identified as R, Z, and Y, which for the purposes of the illustrated compounds are defined below. Although relative stereochemistry is illustrated for each structure, the configuration of
10 chiral centres may vary according to any of the embodiments based on chirality described above.

R = H and Me, Et, Prop, But, etc.
Z = OH, OR, NH_2 , NRH , NR_2

R = H and Me, Et, Prop, But, etc.

Sources of Compounds and Assays for Activity

Pelorol may be obtained from natural sources as taught in the prior art and in the Example 1 herein. Solvent fractionation and/or chromatography may be employed. It is also possible to modify pelorol or other available compounds such as chrysene derivatives by known chemical methodologies to add, remove, or replace substituents in order to produce components of Formula I. Examples of such derivatization steps as applied to different compounds of Formula I are shown in more detail below.

The presence of SHIP 1 modulating compounds in a preparation may be determined by use of a variety of assays, including direct monitoring of a change in activity of SHIP 1 enzyme such as by the methodology disclosed in Example 1 and Figure 1 or by biological assays which may be readily adapted from known procedures, including cell or animal based assays which monitor changes in: nitric oxide production from activated macrophages; IgE induced mast cell degranulation; LPS induced macrophage activation; TNF- α expression or activity. In addition, standard assays for agents which mediate inflammatory activity in living subjects may be employed. Adaptation of these assays is facilitated by the availability of SHIP 1^{-/-} and SHIP 1^{+/-} mice^{15,16} and bone marrow derived macrophages¹⁷. In addition, the availability of anti-SHIP 1 antibodies¹⁸ facilitates use of immunoassay formats. Such assays may also be used to assess activity of compounds prepared by total synthesis, as described herein.

Total Synthesis of Compounds

A synthetic scheme for making pelorol and other compounds of Formula I is provided herein. Tables (1-2) provide detailed examples of two embodiments of such a synthesis with examples of different compounds of Formula I which may be prepared. The compound shown in the Tables that is identical to pelorol except that the ring adjacent the aromatic ring has six members, is termed "homopelorol". Compounds having a six-membered ring are termed "homopelorol analogs". Compounds having a five-membered ring other than pelorol are termed herein, "pelorol analogs".

In the synthesis methods shown in Tables 1 and 2, compounds of Formula IIA shown therein are conveniently based on sclareolide as a starting material. Appropriate derivatives of sclareolide providing desired R₁ – R₄ substituents may be employed. In the aromatic compound of Formula III shown in the Tables, Nu is preferably lithium. X₂ in

the starting compound of Formula III is preferably an activating group such as -OMe or -NHAc. $X_1 - X_4$ may remain as found in the starting material or be appropriately altered to provide the desired substituents for the end product. Protecting groups may be employed on $R_1 - R_4$ or X_1, X_3 , or X_4 . An example of derivatization of the ring comprising L' in Formula IA to produce a desired component Q of Formula I is illustrated in Table 2 where oxidation (e.g. by treatment with OsO_4 followed by treatment with an acid such as HCl) is performed to provide a ketone substituent on the ring.

 Synthesis of Homopelolorol and Homopelolorol Analogs

Pharmaceutical Compositions, Dosages, Administration and Indications

Compounds for use in this invention may be formulated into pharmaceutical compositions in any number of ways, which would be known to a person of skill in the art, all of which are within the scope of the invention. The person of skill in the art may
5 be expected to select appropriate pharmaceutically acceptable salts as well as appropriate pharmaceutically acceptable excipients, diluents, and carriers.

Compounds according to the invention can be provided alone or in combination with other agents (for example, small molecules, peptides, or peptide analogues) in therapeutically- or prophylactically-acceptable amounts, in any pharmaceutically
10 acceptable carrier. Methods well known in the art for making such pharmaceutical formulations are found in, for example, "Remington's Pharmaceutical Sciences" (19th edition), ed. A. Gennaro, 1995, Mack Publishing Company, Easton, PA, incorporated by reference herein. Pharmaceutical formulations according to the present invention may, for example, contain excipients, sterile water, or saline, ethanol, methanol, dimethyl
15 sulfoxide, polyalkylene glycols such as polyethylene glycol, propylene glycol, or other synthetic solvents, oils of vegetable origin, or hydrogenated naphthalenes.

Compounds according to the invention may include hydrophobic compounds, for example, compounds that are substantially insoluble in water, but are freely soluble in solvents such as, for example, ethanol, methanol, dimethyl sulfoxide, or chloroform, or
20 combinations thereof. Formulations containing such hydrophobic compounds may be provided using, for example, micelles, which are formed by amphiphilic compounds under certain conditions. In aqueous solutions, micelles are capable of incorporating hydrophobic compounds in their hydrocarbon cores, or within the micelle walls. Hydrophobic compounds may also be provided by solubilization in triglycerides (oils),
25 for example, a digestible vegetable oil. The solubilized hydrophobic compound in the oil phase may be dispersed in an aqueous solution and stabilized using emulsifying agents, if desired. Alternatively, the hydrophobic compound may be provided in oil and delivered, for example, to the gastrointestinal system where bile salts may function as *in vivo* emulsifiers. Hydrophobic compounds may also be provided as microemulsions which,
30 like emulsions, are liquid dispersions of oil and water, but have smaller particles with an oil phase in a micelle-like "core." Hydrophobic compounds according to the invention may also be provided together with a polymeric carrier, for example, a carbohydrate such

as starch, cellulose, dextran, cyclodextrin, methylcellulose, or hyaluronic acid, or a polypeptide, such as albumin, collagen, or gelatin. Other modes of formulation of hydrophobic compounds may include liposomes, natural and synthetic phospholipids, or solvents, for example, dimethyl sulfoxide or alcohols.

5 The pharmaceutical compositions of the invention may be formulated so as to provide controlled release of the active compound(s) over a period of time. Thus, the formulations could contain, for example, an amount of the compound that would be toxic if administered as a single dose, but whose controlled release does not exceed toxic levels. Biocompatible, biodegradable lactide polymer, lactide/glycolide copolymer, or
10 polyoxyethylene-polyoxypropylene copolymers, for example, may be used to control the release of the compounds. Other potentially useful delivery systems for modulatory compounds according to the present invention include ethylene-vinyl acetate copolymer particles, osmotic pumps, implantable infusion systems, and liposomes.

A "therapeutically effective amount" of a compound is an amount effective, at
15 dosages and for periods of time necessary, to achieve the desired therapeutic result using a compound according to the invention. A therapeutically effective amount is also one in which any toxic or detrimental effects of the compound are outweighed by the therapeutically beneficial effects. A "prophylactically effective amount" of a compound refers to an amount effective, at dosages and for periods of time necessary, to achieve the
20 desired prophylactic result. Typically, a prophylactic dose is used in subjects prior to or at an earlier stage of disease, so that a prophylactically effective amount may be less than a therapeutically effective amount. Amounts considered sufficient will vary according to the specific compound used, the mode of administration, the stage and severity of the disease, the age, sex, weight, and health of the individual being treated, and concurrent
25 treatments.

A preferred range for therapeutically or prophylactically effective amounts of the compounds of the invention may be 0.1 nM-0.1M, 0.1 nM-0.05M, 0.05 nM-15 μ M or 0.01 nM-10 μ M. It is to be noted that dosage values may vary with the severity of the condition to be alleviated. For any particular subject, specific dosage regimens may be
30 adjusted over time according to the individual need and the professional judgement of the person administering or supervising the administration of the compositions. Dosage ranges set forth herein are exemplary only and do not limit the dosage ranges that may be

selected by medical practitioners. Dosage regimens may be adjusted to provide the optimum therapeutic response. For example, a single bolus may be administered, several divided doses may be administered over time or the dose may be proportionally reduced or increased as indicated by the exigencies of the therapeutic situation.

5 In general, compounds of the invention should be used without causing substantial toxicity. Toxicity of the compounds of the invention can be determined using standard techniques, for example, by testing in cell cultures or experimental animals and determining the therapeutic index, i.e., the ratio between the LD50 (the dose lethal to 50% of the population) and the LD100 (the dose lethal to 100% of the population). In some
10 circumstances however, such as in severe disease conditions, it may be necessary to administer substantial excesses of the compositions.

 Conventional pharmaceutical practice may be employed to provide suitable formulations or compositions to administer the compounds to patients, depending on the therapeutic or prophylactic objectives. Any appropriate route of administration may be
15 employed, for example, systemic, parenteral, intravenous, subcutaneous, transdermal, transmucosal, intramuscular, intracranial, intraorbital, ophthalmic, intraventricular, intracapsular, intraspinal, intracisternal, intraperitoneal, intranasal, aerosol, topical, surgical, or oral administration. The formulations used may vary according to the chosen
20 route of administration. Thus, for oral administration, the formulations may be in the form of tablets or capsules; for inhalants, the formulations may be in the form of powders, nasal drops, or aerosols; for transmucosal administration, the formulations may be nasal sprays or suppositories; for transdermal administration, the formulations may be creams, ointments, salves, or gels; etc.

 Therapeutically effective or prophylactically effective amounts of SHIP 1
25 modulators and pharmaceutical compositions of this invention may be administered to patients in need of treatment or prophylaxis for cancer (neoplastic diseases), other cell proliferative disorders, inflammatory diseases and immune diseases. Neoplastic diseases include but are not limited to: leukemias, carcinomas, sarcoma, melanomas, neuroblastoma, capillary leak syndrome and hematological malignancies. Diseases with
30 an inflammatory component include, but are not limited to: rheumatoid arthritis, multiple sclerosis, Guillan-Barre syndrome, Crohn's disease, ulcerative colitis, inflammatory bowel syndrome, psoriasis, graft versus host disease, host versus graft, lupus

erythematosus, Alzheimer's disease and insulin-dependent diabetes mellitus. Diseases related to inappropriate activation of macrophage-related cells of the reticuloendothelial lineage include osteoporosis.

Pelorol and other compounds having the structure of Formula I exhibit SHIP 1 agonist activity. By activating SHIP 1, such agonists are particularly useful in the treatment of inflammatory diseases such as sepsis/septic shock, colitis, inflammatory bowel syndrome, and those involving macrophage proliferation or activation; neoplastic diseases such as myeloid and lymphoid leukemias; as an immunosuppressive agent such as in transplant rejection; hematopoietic disorders; and for affecting mast cell degeneration such as in the treatment or prevention of allergies.

Example 1

In a preliminary screen of 150 marine organism extracts, extracts which activated SHIP 1 in an enzyme assay were identified. Assay-guided fractionation of one of these extracts resulted in the identification of the active compound as being pelorol (Figure 1). The origin and processing of the extracts which tested positive in the screen and the nature of the assay were as follows.

Specimens of the brownish sheet sponge *Dactylospongia elegans* (order Dictyoceratida, family Spongiidae) were collected by hand using SCUBA at a depth of 5-10 m from a protected overhang in Rasch Passage on the outer reef of Madang Lagoon, Papua New Guinea, in January 1995. Freshly collected sponge was frozen on sight and transported to Vancouver, Canada over dry ice. The sponge was identified and for verification, a voucher sample was placed in the Zoological Museum of Amsterdam (ZMA POR. 15986). The frozen sponge (120 g) was cut into small pieces, immersed in and subsequently extracted repeatedly with MeOH (3 x 250 mL). The combined methanolic extracts were concentrated *in vacuo* and then partitioned between EtOAc (4 x 100 mL) and H₂O (300 mL). The combined EtOAc extract was evaporated to dryness *in vacuo* to yield 490 mg of a brownish purple oil, found to contain pelorol.

The assay was performed in 96-well microtitre plates. SHIP 1 enzyme was produced with a hemagglutinin and a hexahistidine tag, from a mammalian expression vector. The His tag was employed to enhance purification. SHIP 1 enzyme (10ng) was incubated with extract or DMSO for 15 minutes at room temperature before addition of

200 M inositol-1,3,4,5-tetrakisphosphate. The reaction was allowed to proceed for 20 minutes at 37 degrees C. The amount of inorganic phosphate released was then assessed by the addition of malachite green reagent followed by an absorbance measurement at 650 nm.

5

Example 2

Pelorol was prepared according to the following scheme, under the specific conditions described below.

To a stirred solution of **1** (1.00g, 3.99mmol) in anhydrous Et₂O (30mL) was added a freshly prepared 1.6M solution of MeLi in Et₂O (3mL, 4.8mmol) in portions for 10 min at r.t. and stirring was continued for another 5 min. The mixture was then treated with 10% HCl (2mL), then transferred to a funnel and extracted with ethereal repeatedly. The combined extracts was washed with NaHCO₃ and H₂O, dried (MgSO₄), filtered and concentrated. The residue was column chromatographed with hexane/Et₂O (6:4) to give 0.74g (70%) of **2**.

To a stirred, cooled (ice bath) solution of (CF₃CO)₂O (9mL, 63.85mmol) in CH₂Cl₂ (40mL) was added 50% aq H₂O₂ (1.8mL, 31.66mmol) and the mixture was allowed to stand in an ice bath for 10min. All subsequent operations were performed at r.t. The solution was treated with solid NaHCO₃ (5.40g, 64.28mmol) for 2 min and after stirring the mixture for 8 min, a solution of **2** (1.80g, 6.76mmol) in CH₂Cl₂ (54mL) was added. The resulting mixture was stirred for 30min and then, after addition of H₂O (10mL), was treated with solid NaHCO₃ in portions for 45 min until the pH reached 7. Finally, the mixture was extracted with Et₂O. The combined extracts were washed with NaHCO₃, H₂O and dried (MgSO₄), filtered and concentrated to give pure **3**.

Compound **3** (1g, 3.6mmol) was dissolved in 10% solution of KOH in MeOH (1mL, 1.78mmol) at 0°C. The resulting mixture was stirred for 10min. After addition of H₂O, the solution was extrated with Et₂O. The extrated was washed with H₂O, dried (MgSO₄), filtered and concentrated to give 0.8g of **4**.

In an oven dried , N₂ flushed 100mL round bottom flask equipped with a magnetic stirring bar was placed 3.24g(15mmol) of PCC, 30 mL of CH₂Cl₂ and 2.4 g (10mmol) of **4**. The mixture was well stirred at r.t. for 2hrs and was quenched by adding 30mL of Et₂O. The resulting solution was filtered through a thick pad of silica gel and concentrated to give a residue. The residue was column chromatographed with hexane/EA (8:2) to give 1.6g (67%) of **5**.

Sodium hydride (24.6mg, 0.82mmol, 80% oil dispersion) and dry THF (5mL) were added to a dry flask equipped with a condenser and dry N₂ flow. To this suspension was added methyl triphenyl phosphonium bromide (0.146g, 0.41mmol) and the mixture was stirred for 10min. Then **6** (100mg, 0.41mmol) in THF (2mL) was added and the mixture was gently reflux for 2h. The reaction was quenched by adding 2mL of methanol and then extracted with Et₂O. After usual work up treatment. 94.3mg of **7** was afforded.

A 1.6M solution of tBuLi in pentane (1.74mL, 2.79mmol) was added slowly to a stirred solution of **7** (612.6mg, 2.52mmol) in dry THF (20mL) at -78°C. After stirring for 30min, a solution of **5** (300mg, 1.26mmol) in dry THF (5mL) was added. The mixture was further stirred at -78°C for 2hrs. Then H₂O (10mL) was added and the mixture was extracted with Et₂O (120mL twice). The combined Et₂O extracts were washed with sat.brine, dried (MgSO₄) and concentrated to give a residue, which was chromatographed on NP Sepak™ to give 280mg (55%) of **9**.

A solution of **9** (40mg, 0.1mmol) in EA (5mL) was hydrogenated over 10% Pd/C (50mg) under an atmosphere of hydrogen at r.t. over night. Filtration and concentration gave 37mg (96%) of **10**.

To a stirred solution of **10** (38.8 mg, 0.1mmol) in CH₂Cl₂ (10 mL), SnCl₄ (0.1mL) was added slowly at -20°C under argon for 2 min. The resulting mixture was further stirred for 20min and then diluted with CH₂Cl₂ (20mL) and poured into ice. The aqueous phase was extracted with CH₂Cl₂ twice (20mL) and combined the extracts, washed with saturated NaHCO₃, saturated brine and dried over MgSO₄. Evaporation to afford **11** (28mg, 76%).

PCC (41.6mg, 0.192mmol) was added to **11** (7.4mg, 0.02mmol) dissolved in 2mL of CH₂Cl₂. The mixture was stirred at gentle reflux for 24 hrs under Argon. The reaction was diluted with Et₂O (20mL) and the resulting dark solution was filter through a NP Sepak™. Concentration of the filtrates and further purification afford 1.5mg (20%) of **12**.

1.5mg of **12** was dissolved and stirred in 2mL of NaOH(10%) solution (containing 0.5mL THF). 5mg Iodine is added subsequently and the mixture was further stirred for 20min and acidified by adding 3mL of 10% H₂SO₄. The solution was extracted with 50mL of Et₂O, washed with saturated brine and concentrated to afford a residue **13**.

38.6mg (0.1mmol) of **13** was stirred in CH₂Cl₂ (1mL) under Argon. BBr₃ in CH₂Cl₂ (2.0mL 1M) was added, and stirring was continued for 1.5h. The mixture was then poured into H₂O and extracted with CH₂Cl₂ (50mL). The combined extracts were then dried over MgSO₄, filtered and concentrated. The residue was purified by NP Sepak™ (hexane:EA=7:3) to afford **14** (25mg, 70%).

35.8mg (0.1mmol) of **14** was dissolved in MeOH (2mL) containing 5% H₂SO₄. Stirring was continued for 2hr and the mixture was extracted with Et₂O, dried over MgSO₄ and concentrated to afford **15**.

Example 7

In addition to causing an increase in activity in the SHIP 1 enzyme assay described for Figure 1, agonist compounds of Formula I exhibit anti-inflammatory actions on macrophages and mast cells in intact cell-based assays, inhibit nitric oxide production from endotoxin activated wild-type macrophages and exhibit anti-inflammatory actions on live subjects. Results obtained for pelorol in NO release and mast cell activation assays are shown in Figures 2 and 3, respectively. Inhibition of NO release was not observed in SHIP 1 ^{-/-} macrophages. Pelorol significantly reduced IgE induced mast cell degranulation.

Procedures used in the cell and animal based assays are described below. Results for pelorol and various analogs within Formula I are shown in Table 3, including results using the enzyme assay described in Example 1.

For the NO release assay, wild-type or SHIP 1 ^{-/-} macrophage cells were aliquoted into microtitre plates (5×10^4 /well) and activated with 1 g/mL endotoxin (LPS) in the presence or absence of test compound or DMSO carrier. The cells were incubated at 37°C, 5% CO₂ for 24 hours and the culture supernatant was removed for NO determination using the Griess reagent. Alternatively, J774.1a macrophage cells were treated with 10 µg/ml of test compound dissolved in DMSO for 40 minutes prior to the addition of LPS. Culture supernatants were collected after 24 hr. for determination of NO concentration using the Griess reagent.

For the mast cell activation assay, bone marrow derived mast cells were incubated at 4°C with anti-DNP IgE for 1 hr. They were then washed twice with 23°C Tyrode's buffer, and incubated in the presence of test compound or vehicle control for 30 minutes before a 15 minute treatment with DNP-human serum albumin. The degree of degranulation was determined by measuring the release of β-hexosaminidase.

For the macrophage TNF-α production assay, J774.1a macrophage cells were treated with 10 µg/mL of test compound dissolved in cyclodextrin for 40 minutes prior to the addition of 100ng/mL LPS. Culture supernatants were collected after 2 hr and 5 hr for TNF-α determination by ELISA.

The mouse ear edema (Evans Blue) assay is a standard model for allergic inflammation. Mice were passively sensitized by intravenous injection of monoclonal anti-DNP IgE antibody. 24 hours later, 10 µg test compound (right ears) in 20 µl

DMSO:Methanol (1:3) or vehicle alone (left ears) were applied 20 minutes followed by application of the inducing agent [20 μ l of 0.15% DNFB in acetone:olive oil (4:1)]. Mice were then injected intravenously with 300 μ l 1% Evans Blue. Vascular permeability was measured at 1 hr after application of the inducing agent by visual inspection and
5 quantification of Evans Blue extravasation in the ear. To quantify the Evans Blue content, ears were harvested at 1 hr post DNFB treatment and Evans Blue was extracted by incubation in formamide at 37°C for 24 hr and quantified by spectrophotometry at 620 nm. Ears pretreated with carrier alone mounted a prompt anaphylactic reaction in response to DNFB challenge. In contrast, SHIP 1 agonists showed a clear inhibition of
10 vascular permeabilization as shown by decreased Evans Blue extravasation.

The mouse ear edema (lymphocyte infiltration assay) is a contact hypersensitivity or ear inflammation model and is a standard *in vivo* model for human allergy. Contact hypersensitivity consists of an initial sensitizing phase and an elicitation phase. The latter phase occurs when the epidermal cells encounter a particular antigen to which they have
15 previously been exposed and is characterized by localized immune cell infiltration, inflammation, and edema. In this assay, female 4 week old (20g) Balb/c mice were sensitized to the haptenizing agent, 2,4-dinitrofluorobenzene (DNFB) by shaving their abdominal region with an electric razor before applying 25 μ l of 0.5% DNFB in acetone:olive oil (4:1, v/v) to the abdominal wall for two consecutive days. Four days
20 after the second application, mice were lightly anesthetized with halothane before being challenged (treated) epicutaneously on each side of the right and left ear with 10 μ l of 0.2% DNFB. All mice received a 500 μ l intraperitoneal (i.p.) injection of [3 H]-methyl thymidine in sterile saline (1 μ Ci/g body weight) 24 hours before epicutaneous challenge with DNFB. Thirty minutes prior to DNFB challenge, the right and left ears were
25 pretreated with test compound in DMSO:methanol (1:3, v/v) or vehicle alone, respectively. Twelve hours following DNFB challenge, mice were sacrificed by CO₂ asphyxiation and 8 mm diameter plugs were taken from each ear and digested in 500 μ l Solvable™ at 60°C for 10-12 hours. Samples were decolourized by the addition of H₂O₂ and analyzed for radiolabelled leukocyte infiltrates by standard liquid scintillation
30 counting.

The colitis assay is based on determining whether a test compound protects mice from TNBS (trinitrobenzene sulfonic acid) induced inflammation. Test compound

(10mg/kg) or vehicle control was injected intraperitoneally into mice just prior to a TNBS enema administration. After 2 days, the colons of the vehicle treated mouse were severely inflamed while the SHIP 1 agonist treated mouse had no signs of inflammation.
